
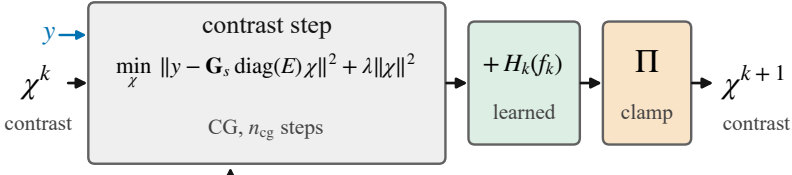
detail of one layer T_k



layer Jacobian DT_k

	$\delta\chi^k$	δw^k
$\delta\chi^{k+1}$	A recorded	B recorded
δw^{k+1}	C closed form	D closed form

$$C = \theta\alpha \operatorname{diag}(E)$$

$$D = (1 - \theta\alpha)I + \theta\alpha \operatorname{diag}(\chi)\mathbf{G}_b$$

A, B: the regularised normal matrix is inverted here, so both blocks are recorded rather than derived
